

Lijst van verboden geneesmiddelen

Let op: deze lijst is nooit volledig!

Voor het opstellen van deze lijst werd gebruik gemaakt van het geccommentarieerd geneesmiddelenrepertorium 2003 en zijn aanpassingen (laatste april 2003) in de Folia Pharmacotherapeutica.

Als het geneesmiddel dat je zoekt niet op deze lijst voorkomt kan dit omdat:

- het geneesmiddel niet in de bovenstaande referentie is opgenomen
- het een buitenlands product is
- het een nieuw geneesmiddel is
- je een onjuiste spelling gebruikt
- je zoekt naar de generische naam en niet naar de merknaam

Als het geneesmiddel dat je zoekt niet op deze lijst voorkomt kan je steeds kijken naar de **lijst van de verboden substanties** en nagaan of één van de substanties die in je geneesmiddel aanwezig zijn op deze lijst voorkomt. Je kan ons ook mailen (dopinglijn@vlaanderen.be) of je kan je arts of apotheker contacteren.

De lijst van geneesmiddelen staat alfabetisch gerangschikt.

Alle geneesmiddelen die in alle omstandigheden zijn toegelaten worden in het zwart weergegeven en achter de naam staat OK vermeld.

De geneesmiddelen die (soms onder bepaalde omstandigheden) verboden zijn, zijn in het rood weergegeven. Achter de merknaam van het geneesmiddel staat de verboden substantie(s) vermeld en wordt via een letter aangegeven tot welke categorie van verboden middelen de stof behoort.

De categorieën van verboden middelen zijn:

- **S:** Stimulantia
- **N:** Narcotica
- **A:** Anabole agentia
- **B2:** beta-2-agonisten
- **D:** Diuretica
- **P:** Peptidehormonen, mimetische substanties en analogen
- **C:** Glucocorticosteroïden
- **B:** bèta-blockers

Deze substanties zijn allemaal verboden voor elke sporter behalve als:

- na het geneesmiddel een * staat: dat betekent dat het geneesmiddel een stof bevat waarvoor één van de volgende grenswaarden in de urine is vastgelegd:
 - o cathine: de concentratie in de urine mag niet hoger zijn dan 5 microgram per milliliter
 - o coffeïne: de concentratie in de urine mag niet hoger zijn dan 12 microgram per milliliter
 - o efedrine: de concentratie in de urine mag niet hoger zijn dan 10 microgram per milliliter
 - o fenypropylamine: de concentratie in de urine mag niet hoger zijn dan 25 microgram per milliliter
 - o methylefedrine: de concentratie in de urine mag niet hoger zijn dan 10 microgram per milliliter
 - o norpseudoefedrine: de concentratie in de urine mag niet hoger zijn dan 5 microgram per milliliter
 - o pseudoefedrine: de concentratie in de urine mag niet hoger zijn dan 25 microgram per milliliter
 - o cannabinoïden: de concentratie aan 11-nor-delta-9-THC-zuur in de urine mag niet hoger zijn dan 15 nanogram per milliliter
 - o morfine: de concentratie in de urine mag niet hoger zijn dan 1 microgram per milliliter
 - o epitestosteron: de concentratie in de urine mag niet hoger zijn dan 200 nanogram per milliliter
 - o nandrolon: de concentratie in de urine mag niet hoger zijn dan 2 nanogram per milliliter bij mannen en dan 5 nanogram per milliliter bij vrouwen

- testosteron: een verhouding testosteron/epitestosteron in de urine groter dan 6 wordt beschouwd als een positief analyseresultaat, tenzij uit bijkomende onderzoeken blijkt dat deze verhoogde verhouding te wijten is aan een fysiologische of pathologische toestand.
 - Salbutamol: de concentratie in de urine mag niet hoger zijn dan 1000 nanogram per milliliter
- na het geneesmiddel een **M** staat: dit geneesmiddel is enkel verboden voor mannelijke sporters.
 - na het geneesmiddel een **B** staat: dit geneesmiddel bevat een bèta-blocker en is enkel verboden in volgende precisie- en concentratiesporten: schietsporten, kunstduiken, biljart, snooker, darts, bowling en kegelen.
 - na het geneesmiddel een **C** staat: het geneesmiddel bevat een glucocorticosteroïde. Het algemeen gebruik van glucocorticosteroïden via orale, rectale, intraveneuze of intramusculaire toediening is verboden. Het topisch gebruik van glucocorticosteroïden via anale, auriculaire, dermatologische, nasale, oftalmologische toediening, via intra-articulaire en lokale inspuiting en via inhalatie is toegestaan.
 - na het geneesmiddel een **I** staat: het geneesmiddel bevat insuline en is wel toegestaan voor de behandeling van sportbeoefenaars met insuline-dependente diabetes
 - na het geneesmiddel de code **B2A** staat: dit geneesmiddel is toegelaten onder aërosolvorm.
 - Na het geneesmiddel de code **ADR** staat: dit geneesmiddel bevat adrenaline en is toegelaten in lokale anesthetica.
